This version contains some corrections and improvements for previous 715 version:

- Cut Quality calculations mistakes are fixed. Correct (current, v.724) values correspond to older (695) versions of DiamCalc
- Some improvements are made in import of cuts from STL files, to make possible import corrupted data from files generated by third-party software.
- Polish reports issues: Diameter calculation is now fixed to use correct math rounding instead of GIA rounding. The "Use GIA grading rules" checkbox still remains forcibly switched on, but only affects calculation of Girdle height, which we believe should be always done by GIA rules.
- New option in DCPro: possibility to add Carat weight and Spread of the diamond into DCPro_Report.txt output file:
